GMAL CHATBOT USING PYTHON

■ ANOOP THOMAS MATHEW

Imagine your friend chatting with you on Gmail Chat when you are actually standing just behind him. He is receiving replies automatically from your account without your inputs. This is actually possible with Gmail Chatterbot—a computer program designed to simulate conversation through a variety of methods.

Here we present a small simulation program that generates automatic replies to a Gmail Chat user's inputs. The primary aim of the program is to fool the person into believing that the chat response is being given by the user at the other end.

The entire programming is done

Fig. 1: Chatterbot programming logic

and tested in Python on Linux platform. The same can also be done on MS Windows. The logic of the program is simple (refer Fig. 1): Start chatting using XMPP (eXtensible Messaging and Presence Protocol) by sending

your queries to a PyAIML input parser to generate an automatic chat response. This chat response is posted to the client on the other side of the network.

Why Python?

Python doesn't provide a rich syntax, which is really helpful as you don't have to spend time trying to figure out what command you should use.

This language is interactive, portable, easy to learn and easy to use. Furthermore, it provides dynamic semantics and rapid prototyping capabilities.

Python is largely known as a glue language that connects existing com-
