

Satellite Communications: Second Edition

This second edition aims to provide the reader with a sound understanding of how a satellite communication system successfully transfers information from one earth station to another.

The basic material relating to satellite orbits, look angles, transponders on communication satellites, link budget calculations, signal-to-noise ratio and bit error rate for analogue and digital links, multiple access techniques, error control and propagation of radio waves through the earth's atmosphere remains as important as in the first edition.

The emphasis throughout the text is on digital transmission techniques. Much material that was in the first edition has been omitted to make way for chapters covering very small-aperture terminal systems, low-earth-orbit and non-geostationary satellite systems, direct broadcast television and satellite navigation.

Operational Amplifiers and Linear ICs: Third Edition

Designed as a textbook for undergraduate students of electronics and communication engineering, this third edition commences with a discussion of the basic operational amplifier (op-amp) internal circuit and goes on to explain the operation of voltage followers and non-inverting and inverting amplifiers. Op-amp parameters and performance limitations are investigated next, followed by the design and analysis of direct-coupled and capacitor-coupled op-amp circuits.

The book includes five new chapters on noise in op-amp circuits, sinusoidal oscillators, audio power amplifiers, digital-to-analogue and analogue-to-digital converters, and phase-locked loop. Additional topics covered include IC voltage comparator, IC timer circuits, switching regulators, switched capacitor filters and IC power amplifiers.

Data Structures Using C

Useful for undergraduate students of computer science as well as postgraduate students of computer applications, this book explains the concepts of data structures and their application in problem solving.

The book starts with an overview of the concepts of C programming followed by pointers and functions. It then connects these concepts and applies them to the study of various data structures such as arrays, strings, linked lists, stacks, queues, trees and graphs. A separate chapter on efficient binary trees discusses concepts such as AVL trees, M-way search trees, B and B+ trees and splay trees. In addition, the book details sorting techniques and hashing, and the attributes and organisation of files.

The book makes use of numerous algorithms, programs and illustrations to explain the concepts.
