

BINAY- Lighting Up The Future

Binay LED Aviation Obstruction Lights

**BINAY LED-based MEDIUM INTENSITY
Aviation Obstruction Light Beacon**

*As per the International Civil Aviation Organisation (ICAO) requirements
for use on structures above 45m*

*Available in Low Intensity and Medium Intensity versions (as per
the International Civil Aviation Organization guidelines), BINAY's
patented LED Aviation Lights come with a 5-year warranty*

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave, and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

**THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED
PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT**

in this exchange. Called RePriv, the system tracks the user's behaviour via a Web browser but controls how the resulting information is released to websites that want to offer personalised services, such as a shopping site that automatically knows users' interests.

The RePriv browser tracks the user's behaviour to identify his top interests, as well as the level of attention devoted to each. When the user visits a site that wants to offer personalisation, a pop-up window describes the type of information the site is asking for and gives the user the option of allowing the exchange or not. Whatever the user decides, the site doesn't get specific information about what the user has been doing—instead, it sees the interest information RePriv has collected.

RePriv's default in-browser mining can be done with no noticeable overhead to normal browsing, and the results it produces converge quickly. It enables high-quality personalisation, and the performance impact on the browser is minimal.

Face and object recognition software

A new video recognition software has been developed that can recognise faces and their gestures, different objects or just about anything that you show to it. You could then track the object, monitor it and use it for different purposes such as video surveillance and law enforcement. Called Predator, the software is Open Source and developed by Ph.D researcher Zdenek Kalal at the University of Surrey in England.

The software, nicknamed TLD (Tracking-Learning-Detection), learns as it tracks your movements within the frame registering the view from different angles so that it could use it for future use. If the object getting tracked ever moves out of the frame, Predator recognises it as soon as it is back and starts tracking it again.

According to Kalal, the software can be used in areas such as human computer interactions, augmented reality, video post-production, motion capture, visual surveillance, robot navigation and assisted driving.

iOS: An 'easier' platform to develop for

According to a survey, mobile application developers prefer the iOS platform to the Android ecosystem. Android was followed by Blackberry's OS and in the end came Nokia's Symbian.

The survey carried out by Baird's William Powers points out that about 57 per cent of the 250 developers surveyed considered 'fragmentation' in the Android ecosystem as a huge problem. Developers have also complained about the dimmed visibility to their applications due to the presence of junk apps in Android. There are too many apps for one to choose from.

Google responded by making a Web version of the Android Market, but several other facets need to be considered. One of them is hardware inconsistencies. Android ships in different form factors with varying processor power,
