

BEST INVERTER FOR YOUR HOME

Inverters are today more intelligent and user-friendly than ever before. Bring home one that fits your power-backup requirement and budget

■ UMA BANSAL

Today, you need an inverter not just to light up bulbs and run fans but lifestyle products like air-conditioners and LCD TVs too. Keeping in sync with the consumer expecta-

tions, the technology has evolved and now the inverters are more feature-packed than ever.

Given the many options available, selecting the right inverter for your home has become a tough task. There are several things to consider, like:

1. Do I need a built-in UPS?

2. Which type of inverter (square-wave, modified sinewave or pure sinewave) will suit me?

3. How much inverter capacity do I need to run the desired loads?

4. How long can I run the appliances on the inverter? (This depends on the battery size (in ampere-hours) and the type of batteries used.)

5. Protection and other features such as battery level (in per cent) display, load display, auto-adjustment to battery and no-load shutdown

Here is the way to go.

How different are today's inverters?

The concept of inverter has been replaced with home UPS—inverters that run computers too along with home appliances. Home UPS are basically the inverters with built-in UPS featuring over- and under-voltage protection. So your PC isn't affected by wide voltage fluctuations. Also, your PC doesn't re-boot as changeover time from mains to battery is fast.

Inverters have also become more efficient and user-friendly with LCDs fitted on their front panel.

Su-Kam has a range of generator-compatible inverters that are claimed to not only save power and reduce pollution but also cut down on the diesel cost.

Luminous inverters come loaded with an intelligent software that adapts its functionality according to the power-cut frequency as well as the climatic conditions.

The size of home UPS is shrinking to fit in minimal home space. upsINVERTER.com claims its 800VA Hi-Lite to be the smallest home UPS with just 3 kg of weight.

Do I need a UPS or inverter?

'UPS' and 'inverter' terms are used interchangeably, though these are not exactly the same. A UPS (uninterrupted power supply) is just a system which allows instant switchover to the power back-up source in the event of a
