

ter electricity distribution networks, increased electricity availability and frequent season changes. This year shortened spans of summer heat could be blamed for the lower demand," reasons Yogesh Dua, partner, upsINVERTER.com.

Inverters for offices

In many offices, inverters are catching up as an alternative backup power solution for non-critical applications such as emergency lighting and to run non-life supporting equipment in clinics and hospitals. High-capacity inverters are also used to operate lifts, air-conditioners, air coolers, elevators and even telecom applications. In small offices, these are used to operate EPA-BXs, phones, fax machines, laboratory equipment, etc.

Inverters are cleaner than DG sets as they do not produce smoke. As some of the features are almost like UPS systems, they can be used in the SOHO and SMB sector as prime power backup devices.

Inverters and UPS: What's the difference

UPS and inverter terms are used interchangeably. A UPS (uninterruptible power supply) is just a system that allows instant switchover to the power backup source in the event of a power failure. Home UPS are inverters with built-in UPS featuring over- and under-voltage protection which can be used to run computers too along with other electronic appliances so that the PC is not affected by wide voltage fluctuations. Also, the PC doesn't reboot as changeover time from mains to battery is fast.

Home segment: assemblers at a disadvantage

Inverters are an integral part of our daily life. These are used all the time but purchased only once in a few years. A non-standard product can cause bigger losses to the user than the cost of the inverter system itself. With a poor-quality power-backup system, the user also runs the risk of damage to his costly home appliances. In fact, non-standard and locally assembled inverter can be risky for use at home.

Latest technology, high quality standards in production, and good service and support make branded inverters better than those assembled locally

by unorganised players.

"In the inverter industry, the key to success is a robust and reliable design that can withstand steep fluctuations and high voltages up to 440 volts and phase-to-phase input in rural areas. Also, good after-sales service plays a very important role in this field. As demand is shifting from urban to rural areas, small players cannot afford to service the needs of customers in every nook and corner. Hence companies having better design and a strong service network still have competitive edge over others. The inverter assemblers find it difficult to provide robust and economical design as well
