

Acer's K330

Features

- LED pico projector
- Resolution: WXGA 1280x800
- Contrast ratio: 4,000:1
- VGA, HDMI, composite video inputs, AV input, SD card slot and USB port
- Weight: 1.24 kg

Price: ₹ 54,000

signal is fed to the projector, it is most likely to produce a low-quality image. This is more noticeable on a larger screen. For good results, try to match the projector's resolution with the native resolution of your video source.

Contrast ratio. Contrast ratio measures the difference between the brightest and darkest spots of an image. It is expressed as a ratio; for example, 600:1 or 2220:1. Projectors with high contrast ratios produce well-defined pictures.

Connections. There are various connection ports to look for in a projector. Typically, a home theatre projector has an HDMI input to allow digital transfer of videos from a DVD player or other source component with either an HDMI output or a DVI-HDCP output via a connection adaptor.

A VGA-PC monitor input allows you to connect a PC or laptop to the projector. A serial port for external control to the projector and other possible functions, and a USB port may also be available. However, not all projectors have these inputs. A 12V trigger connection allows certain types of wired remote functions. There are also component video inputs and a composite or standard analogue video input as well.

Your source components, such as

the DVD player or AV receiver, too will have one or more of these types of connections, which need to be properly matched to the connection on the video projector.

A home theatre projector, however, has usually no audio connection, even though HDMI can pass audio as well as video. You can use an external home theatre system, stereo system or amplifier to provide the audio functions.

Choose your HDMI cable properly. If you have Internet-compatible devices like PlayStation 3 and Blu-ray player, an Ethernet-capable HDMI cable is recommended. This will enable transmission of Internet signals through the cable itself. With more and more Internet-capable devices hitting the market, it's better to invest in Ethernet-capable HDMI cables to make the projector future-proof.

Lamp life. Home-theatre projectors typically have a lamp life of 2000-4000 hours. This specification actually refers to the 'half-life' of the lamp – the point where the lamp is half as bright as it was when new. The average projector used for movies and special events runs eight hours a week. At this rate, the lamp will last about 4.8 years.

Portability. If you move or travel a lot with your projector, portability is
