

Sony's VPL-VW90ES

Features

- SXRD 3D front projector
- 24p True Cinema
- 240Hz panel drive
- Resolution: 1920x1080
- Dynamic contrast ratio: 150,000:1
- Gamma Correction mode (11 options)
- Two HDMI inputs
- Fan noise: 20 dB

| Price: ₹ 520,000

Vivitek's H5080

Features

- Resolution: 1080p (1920x1080)
- Brightness: 1700 lumens for dazzling images
- Contrast ratio: 25,000:1 (full on/full off)
- Lamp life: 3000/2000 hours (standard/boost mode)
- Weight: 8.6 kg
- Dimensions: 431x180x343 mm³
- Throw ratio: 1.54 to 1.93:1 (distance/width)

| Price: ₹ 287,000

Note: Some products carry estimated market price which may vary with location and taxes

an important aspect. It will also help in easy installation and setup like while trying different screen sizes, distances and different rooms to see what works best.

Others. Look for projectors with more control settings. Multi-colour processing technology like Brilliant-Color and sRGB modes will allow you to tweak the projector's display to your

liking. Other features to look for include zoom, cinema mode, multiple aspect ratio support and internal scalers.

Now even 3D home theatre projectors are available in the market. These also feature real-time 2D-to-3D conversion. 3D glasses are cheaper than in the past. Many companies are working on autostereoscopic (glasses-free) 3D technology. However, it is not available in

3D home theatre projectors yet. Keep in mind that the brightness of a projector is cut to half when in 3D mode.

Installation

A home theatre projector can be mounted on a ceiling or placed on any flat surface. To avoid cord-clutter, it is better to install the projector as part of your home theatre system with all connecting cables neatly passing through the walls. Also, it will keep your projector secure, give a polished look to the area and save time of setting for each use.

Ceiling-mounted projectors are less portable, and you need to know the fixed distance between the projector and your screen. This is because of the throw ratio of the projector. Throw ratio is the relationship between the projector's distance from the screen and the width of the image and it differs for different projectors.

If you want a tabletop projection, go for a projector with less fan noise. You might also like to go for a product with good exterior design as it would be more visible.

Another important thing to keep in mind is the projector screen. You can project the video on an empty white wall or use a screen. However, if you plan to move your projector around, get a screen. Screens can be wall-mounted, retractable or free-standing. Choose as per your requirement.

Projector screens come in a variety of sizes. Screen dimensions are usually included in item listings and the characteristics of your space can help you determine the right screen size. To find a screen that fits your room, measure the length, width and depth of the area where you plan to put it. You need to sit at least four to five metres away from the screen for good viewing.

Select your projector's settings before installing the ceiling-mount projector, and wall-mounted or retractable screen as post-installation it won't be convenient to change these settings again and again. ●
