Miniature rotary switches

SWITCHCRAFT has introduced 'A' and 'B' series miniature rotary switches rated for 2A, 125V AC. 'A' series offers three configurations—1-pole 8-way, 2-pole 4-way and 4-pole 2-way. 'B' series offers 1-pole 12-way, 2-pole 6-way and 4-pole 3-way configurations.

All these switches have an adjustable stopper arrangement and wiping-type self-

cleaning silver-plated brass contacts.

Automotive-grade non-synchronous boost controller

ON Semiconductor has introduced an automotive-grade non-synchronous boost controller that offers 3.2V to 44V, which can be used to drive an external n-channel MOSFET.

The NCV8871 has a 3.0μA quiescent current in sleep mode, peak cur-

rent mode control with internal slope compensation, and synchronisable switching frequency with two available versions that can be typically set at 170 kHz or 1 MHz.

The device supports multiple topology configurations, including boost, flyback, SEPIC and multiphase.

Radio receiver IC

EDOM Technology has released Silicon Labs' multi-band radio receiver IC solution. Based on a patented low-IF digital architecture, the Si484x offers integration in CMOS, reducing radio component count by more than 70 per cent. Mechanical tuning enables radio users to hear the exact channel that is being displayed.

The receiver's automatically-tuned RF front-end circuitry adjusts to reject noise and amplify the target signal. The IC also enables display indicators for valid stations, mono/stereo signals and tuned frequency.

Power MOSFETs

Infineon Technologies has introduced a family of single p-channel, 40V power MOSFETs for automotive applications.

The OptiMOS P2 chips provide currents from 50A to 180A in various standard packages for more than 30 derivatives. Compared to n-channel MOSFETs, these chips do not require additional charge pump devices to implement high-side switches that drive DC brush motors or brushless three-phase DC motors.

In combination with pulse-width modulation control, the MOSFETs offer a better thermal behaviour and a better avalanche performance than n-channel MOSFETs. This makes them ideal for reverse battery protection and motor control applications in cars.

Panel control models

Bourns has introduced two industrial-grade panel controls—Model 54 and Model 56—which are an extension of Model 51/53 series with an added double-pole, double-throw push-pull switch module and single-pole, double-throw rotary switch module, respectively. These products are said to be high-performance alternatives to readily available consumer-grade potentiometers with pushpull and rotary switches. Developed to match the requirements of a broad range of industrial, medical and aerospace/avionics applications,
