

Design With Low Power, High Precision Op Amps

Microchip Offers a Broad Range of Op Amp Solutions

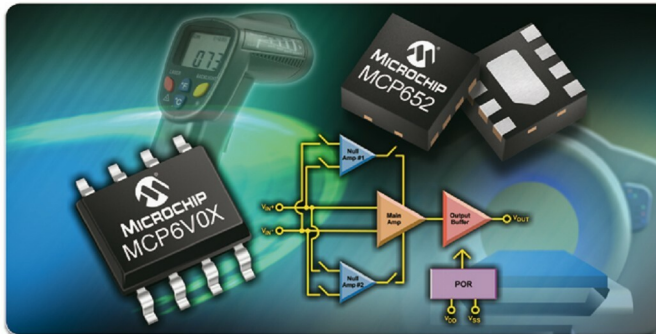

Microcontrollers

Digital Signal
Controllers

Analog

Memory

RF & Wireless

Microchip offers a broad portfolio of operational amplifiers in an advanced CMOS technology. With over 100 unique products spanning bandwidths from 10 kHz up to 60 MHz, Microchip has the right solution for your application.

The op amp families include devices that operate with quiescent current as low as 350 nA and support operating voltages as low as 1.4V. In addition, select families offer industry leading, ultra low offset voltages of only 2 μ V maximum. The combination of low power, small packaging and superior performance make Microchip's op amps ideal for a wide variety of applications that span the industrial, consumer, automotive and medical markets.

Additional product range features include:

- Low offset voltage, 2 μ V maximum
- Low current consumption down to 350 nA
- Low voltage operation, down to 1.4V
- Rail-to-Rail input/output
- Low bias current (1 pA typical)
- Unity gain stable
- Extended temperature range of -40°C to +125°C
- Small package formats including – SOT-23, SC-70, MSOP, TSSOP TDFN, DFN, SOIC

Microchip's free FilterLab® software tool simplifies active filter design. The active filter software design tool provides full schematic diagrams of the filter circuit with component values and displays the frequency response.
