| Price: ₹ 91,990

Note: Some products carry estimated market price which may vary with location and taxes

3D. Many companies are coming up with 3D models. There is not much 3D content broadcast as of now, but you can surely watch your favourite 3D movies from a Blu-ray disk. Also, as you are investing a reasonable amount for the TV, you better be prepared for the future.

3D content needs 3D glasses for viewing. These glasses are of two types: active shutter, and passive or polarised.

Active glasses have a receiver with the transmitter in the TV. These offer a high-quality image, but are bulky and practically a little uncomfortable while watching TV. Also, one has restricted movement to avoid any loss or interruption in transmission of signals.

Passive glasses are the ones that we usually get in movie halls for watching a 3D movie. These do not provide the high-quality image like active glasses but are much lighter, cheaper and practical.

You have the option to view 2D content on your 3D TV without having to wear glasses. You can also switch to a mode where you convert the 2D content into 3D and watch it with your glasses on, but it doesn't give true 3D experience.

Some buying tips

Two things that you must consider before selecting a TV is the depth of your pocket and the size of the room where you want to watch the TV. Knowing which TV size suits your room will save a lot of hassle. There is no point going for a huge TV in a small room.

For the best viewing pleasure, you need to sit at a proper distance from the TV. This distance depends on the size of your flat-screen TV:

1. For an 81 to 94cm (32 to 37-inch) display, you should sit about two to two-and-a-half metres away from the screen.
2. For 107 to 117cm (42 to 46-inch) displays, you should sit 3-4 metres away.
3. For 127cm (50-inch) displays, you should sit 3.5 to 5 metres away.
