Chipsets

EDOM Technology has introduced Silicon Labs' Si24xx data modem ICs that combine voice and machine-to-machine (M2M) connectivity.

The ISOModem chipsets draw 56mW power in normal operation (on-hook, idle). Sleep and wake-on-ring (WOR) modes are available to reduce power consumption to 0.3 and 15 megawatt, respectively. This capability

allows a system to appear to be 'always on' while consuming very little power and still responding to events on the telephone line.

Analogue resistive USB touchscreen controller

Microchip Technology has launched mTouch AR1100 analogue resistive USB touchscreen controller. Build

upon the AR1000 analogue resistive touchscreen controller series, the AR1100 controller is available as a turnkey chip or board product.

The controller features calibration options for alignment and linearisation

and supports all four-, five- and eight-wired touchscreens with free drivers for most major operating systems. It is available in 20-pin SOIC, SSOP and QFN packages and also as a board product in production quantities.

Digital variable gain amplifiers

National Semiconductor has introduced a pair of quad- and dual-channel, digital variable gain amplifiers (DVGA).

Supplied in a 54-pin LLP package, the LMH6522 features 49dBm third order output intercept point (OIP3) at 200MHz input frequency, precise 1dB gain steps over a 31dB range and 8.5dB noise figure at maximum gain.

The LMH6521 is supplied in a 32-pin LLP package and features 48.5dBm OIP3 at 200MHz input frequency, channel gain/phase matching of +/- 0.04dB and +/- 0.45 degree, precise 0.5dB gain steps over 31.5dB range and noise figure of 7.3 dB at maximum gain.

Backplane connector products

FCI has released Xcede vertical backplane headers and right-angle daughter card receptacles designed for 25Gbps performance.

Vertical backplane header configurations provide two, four or six differential signal pairs per column wafer with four, six or eight wafers per signal

connector module. The vertical header range also includes options with two-, three- or four-wall connector shrouds. Among the three-wall options are versions with integrated guide posts and polarisation key openings.

Connectors with six differential pairs per column fit 36mm minimum card slot pitch and provide 82.4 differential signal pairs per 2.5 cm (1-inch). Four-pair connectors provide 54.9 signal pairs per 2.5 cm and can be used down to 25mm card slot pitch. Two-pair connectors fit on as little as 15mm slot pitch and support 27.5 signal pairs per 2.5 cm along the card edge.

Current mirror

ON Semiconductor has introduced CAT2300 current mirror with switch controller.

CAT2300 offers a single-chip alternative to a discrete circuit approach

and provides sensorless precision current measurement of 0.9V to 5V power supply rails. The device performs current mirroring to 70mA, which equates to 25A of measured current,
