Wearable wireless medical devices to top 100 million units

The global market for wearable devices will reach more than 100 million units annually by 2016 as a range of factors combine over the next five years to drive consumer and health-care adoption, reports ABI Research. These devices, ranging from heart rate monitors for measuring an individual's performance during sports to wearable blood glucose meters, will all enable greater detail in tracking, monitoring and care—often through connections provided by mobile phones.

Ultra-low power wireless technologies such as single-mode Bluetooth 4.0, existing proprietary and the planned 802.15.6 specifications are combining with mobile handsets and social networking application capabilities to drive adoption of a new generation of body-worn sensors. These sensors have the capability to automate details on an individual's activities to inform friends and drive advice and feedback.

Verma to head NEC's identity solutions business

NEC India has appointed Rajan Verma as the head of its public safety and identity solutions business in India.

Verma will be responsible for driving the growth of NEC's identity solutions business in India with special focus on criminal, civil identification and banking segments, and strengthening NEC's capability as a systems integrator in India. He brings with him an in-depth understanding of the IT security solutions industry and a strong senior-level management background from some of

the major IT and telecom companies in the industry.

National Instruments appoints new VP

National Instruments (NI) has named Ajit Gokhale as the vice president of product marketing. In this role, Gokhale, who most recently served as the general manager for the NI UK, France, Ireland and Portugal offices, will oversee product marketing for the National Instruments core platforms of data acquisition and instrument control.

Windows 7 to run on 42 per cent of PCs

Windows 7 will become the leading operating system (OS) for PCs worldwide, running on 42 per cent of PCs in use by the end of 2011, according to Gartner. 94 per cent of new PCs in 2011 will be shipped with Windows 7.

"Steady improvements in IT budgets in 2010 and 2011 are helping to accelerate the deployment of Windows 7 in enterprise markets in the US and Asia/Pacific. However, the economic uncertainties in Western Europe, political instability in selected Middle East and African countries and the economic slowdown in Japan after the earthquake and tsunami in March 2011 will likely lead to slightly late and slow deployment for

Windows 7 across those regions," said Annette Jump, research director at Gartner.

e-commerce to zoom in India

e-commerce in India was about \$5 billion until last year and is estimated to grow to \$40 billion by 2015. Rajan Anandan, head of Internet giant Google's India operations, believes the country has the potential to reach this estimate before that.

India last year crossed 100 million Internet users despite poor Internet penetration and sluggish Internet speed. These 100 million users in question spent about 16 hours a week online. These figures make Rajan hopeful about the e-commerce boom in the country. Anandan believes that this is just the beginning. If an interesting value proposition exists, Indians will figure out how to get to it.

Out of the four mega trends in the Internet space in the country, the first is monetisation of 100 million users through e-commerce. That is, companies will figure out how to make money out of the 100 million users who are online.
