

“Indian market is the most demanding. By focusing on domestic market you can win the race”

Dinesh Singh, CEO, LWI Electronics Inc., talks to Atul Goel from EFY magazine, about the electronic components market and their strategy

■ DINESH SINGH
CEO, LWI ELECTRONICS INC.

How do you see the market for electronic components in India?

Unfortunately, due to inclination towards foreign goods, majority of the Indian franchises are more of brokers and not stockists. They order semiconductor components from foreign countries and then supply the same. However, the business is not as rosy as it appears. Equipment routed from China and Singapore throw up major challenges. Here devices are tampered, refurbished, counterfeited and quality standards are not met. This is affecting not only India but also the global market.

Some customers, who fall prey to the cheap Chinese parts, often come back to us in their production crises for genuine parts after losing time and revenue to such faulty parts.

What are the key developments happening in the area of electronic components?

With the growing middle-class population of nearly 400 million people, India's electronic equipment consump-

tion, which was estimated at around \$110 billion in 2010, is expected to reach \$363 billion by 2015.

What are the main component-types that LWI distributes?

LWI distributes military/industrial grade parts like integrated circuits, capacitors, resistors, discrete devices, linear logic, digital signal processors, dynamic random access memory, static random-access memory, cache memory, connectors, LAN products and much more. LWI stocks obsolete products that even the manufacturers do not keep. Today LWI stocks over 100,000 line items of new and obsolete semiconductor components. We expect to double our line items by 2013.

LWI stocks obsolete products that even the manufacturers do not keep. Is there a considerable demand for such products? If so, from whom?

If you think obsolete electronic spares are worthless just because the market is flooding with novel electronic items, which become out of date within a short span, then you
