

SECURITY SYSTEMS FOR SAFE HOMES

With the ever spiralling real-estate prices, homes are getting dearer and their status as the immortal possession is justifiable. Home security systems provide the blanket of self-assurance, which is deemed as a vital requirement than a priced add-on

■ SWATI SHARMA

There is no place like home. It is the most secure and serene place you can ever be. But with the increasing crime rate and chances of any accidents, how sure are you about the safety of your house? Here comes to your rescue, numerous innovative products that are available in the market to ensure your home's safety.

There are various security devices available for residential users. Technology has allowed us to secure our valuables and keep track of them

even while we are away from home on holidays.

A home security system generally consists of detectors or sensors, speakers, lights and a computer or control pad that links everything together. Most common systems being installed these days include closed-circuit television (CCTV) systems, intruder/burglar alarm systems, alarm system with gas detection, digital doorlocks and video door phones as a replacement for conventional door bells.

You can get a home security system customised to your needs after knowing the various options available. Some devices, which incorporate a home security system are:

Motion sensors. These sensors detect physical movement and turn on an alarm if there is any intrusion. Be sure to have your motion sensor carefully calibrated so that birds and pets don't trigger a false alarm.

Heat sensors. These sensors detect sudden changes in room temperature caused by the presence of a warm-blooded body or fire.

Video monitoring systems. These include CCTV cameras, which can produce images or recordings for surveillance purposes. CCTVs can be video cameras or digital stills cameras.

Video cameras are either analogue or digital, which means analogue or digital signals are sent to a storage device such as a video tape recorder, desktop or laptop computer. There are also IP or network cameras that are either analogue or digital video cameras with an embedded video server having an IP address, capable of streaming the video (and sometimes, even audio). That way you can watch your house wherever you are!

Today, with various technological advancements, video surveillance cameras are better than ever and can be used with computers for more complex situations. The concept of IP surveillance camera is picking up fast and overshadowing the CCTV technology. This shift is primarily because of the network-enabled feature and the high luminous factor.

IP CCTV has come a long way since it was first introduced and has now reached the stage where it is very reliable. IP CCTV can in fact be more
